```

# * It is very hard to compare the HR as different predictors are on
  ↪ different magnitudes, so we need to normalize them.
time_col <- data$time
event_col <- data$event
data <- data %>%
  select(-c(time, event)) %>%
  mutate(across(where(is.numeric), scale)) %>%
  mutate(
    time = time_col,

```

```

    event = event_col
  )

```

Note now the interpretation of HR is different! For example, if HR=1.16 for the predictor in the univariate model fitted using scaled data, it means that each standard deviation increase is associated with 16% higher risk of event.

HRV_MFDFA_alpha1_Asymmetry	1.86e-02	1	0.8915
HRV_MFDFA_alpha1_Fluctuation	5.17e-01	1	0.4721
HRV_MFDFA_alpha1_Increment	2.13e-01	1	0.6443
GLOBAL	1.15e+02	97	0.0974

The proportional hazards assumption was tested using Schoenfeld residuals. None of the variables violated the PH assumption (all $p > 0.05$), indicating that the Cox proportional hazards model was appropriate for our analysis.

Variable Selection

LASSO

```
# * LASSO doesn't allow missing values
set.seed(1234)
# x <- as.matrix(data_complete %>% select(-c(time, event)))
# * We need to explicitly use model.matrix for categorical variables
x <- model.matrix(~ . - 1 - time - event, data = data_complete)
y <- Surv(data_complete$time, data_complete$event)
cox_model_lasso.cv <- cv.glmnet(
  x,
  y,
  family = "cox",
  alpha = 1, # 1 for LASSO, 0 for Ridge
  nfolds = 10
)
```

```
# plot(cox_model_lasso.cv) # Plot partial likelihood deviance vs log(lambda)
print(cox_model_lasso.cv$lambda.min)
```

```
[1] 0.002211303
```

```
print(cox_model_lasso.cv$lambda.1se)
```

```
[1] 0.01075268
```

As mentioned in the paper, we will use the value of hyperparameter `lambda.1se` that gave the most shrunk model but still was within one standard error from the value that gave the lowest error. This is shown to produce consistently better performance than `lambda.min`.

```
cox_model_lasso <- glmnet(
  x,
  y,
  family = "cox",
  alpha = 1,
  lambda = cox_model_lasso.cv$lambda.1se
)
cox_model_lasso.coef <- coef(cox_model_lasso)
print(cox_model_lasso.coef)
selected_vars <- rownames(cox_model_lasso.coef)[which(cox_model_lasso.coef !=
  ↪ 0)]
print(selected_vars)
```

```
# * To visualize the LASSO path, we should not supply lambda
cox_model_lasso_fullpath <- glmnet(
  x,
  y,
  family = "cox",
  alpha = 1
)
```

```
# plot(cox_model_lasso_fullpath, xvar = "lambda", label = TRUE)
autoplot(cox_model_lasso_fullpath, xvar = "lambda", label = TRUE, label.size
  ↪ = 15) +
  theme_bw() +
  theme(legend.position = "bottom") # better way of visualizing the LASSO
  ↪ path
```

Stepwise Selection based on BIC

```
# * Stepwise selection doesn't allow missing values
cox_model_step <- MASS::stepAIC(cox_model_full_complete,
  direction = "both",
  k = log(nrow(data)), # Use BIC instead of AIC
  trace = FALSE
)
```

```
summary(cox_model_step)
```

Call:

```
coxph(formula = Surv(time, event) ~ age + sex + BMI + hypertension_treatment +
      hdl_chol + max_workload + HRV_Prc20NN + HRV_HTI, data = data_complete)
```
